

Integrate systems to connect processes and unify data with Oracle Primavera Unifier

Primavera Unifier enables end to end processes using RESTful APIs, Oracle Cloud Infrastructure integration services, Project Integration Platform, and support for virtually any middleware.

RESTful APIs

All of the Primavera Unifier APIs are RESTful, providing better performance and ease of use than more traditional SOAP APIs. All Unifier APIs are included with Primavera Unifier licenses and accessible by customers, partners, and consultants without restrictions or metering. The comprehensive nature of Unifier APIs enables full access to all data within the solution for both SaaS and on-premise implementations.

Primavera Data Service provides access to the data in cloud-based Primavera solutions. Access to Primavera Unifier business-level data and database-level data, including SQL access over REST APIs, helps ensure every piece of data within Primavera Unifier is accessible, can be included in processes, sent to external systems through integrations, exported to data warehouses, and used to feed predictive models.

Support for virtually all middleware

Primavera Unifier's RESTful APIs work with virtually all middleware solutions. For customers who do not yet have a middleware solution, Primavera Unifier uniquely provides access to Oracle Cloud Infrastructure integration services technology with Primavera Unifier licenses, at no additional cost.

Oracle Cloud Infrastructure integration services

Primavera Unifier is deployed on Oracle Cloud Infrastructure (OCI) and leverages native Oracle integration services within OCI to further ease integration and data movement. Integrations can be called with the click of a button to enable real-time data flow from within Primavera Unifier workflow steps, for example being able to pull in the latest payment information from an ERP system against a contract when evaluating a change request in Primavera Unifier.

Oracle Cloud Infrastructure integration services adapters

Oracle integration services provides adapters which work with Primavera Unifier and common integration end points such as ERP systems. View a [list of OCI adapters here](#). Adapters enable users to save time by providing wizard-based configuration for security end points, and data structure instead of complex, manual integration design. Oracle integration services' adapters enable customers to build integrations using our no-code and low-code tools.
