Meet your partner-friendly transaction platform

Own your partner ecosystem with our open APIs

From online ordering and delivery to mobile and contactless payment processing, partner integrations can be an excellent way to adapt your point-of-sale experience. Still, for many food and beverage brands around the globe, finding a transaction platform that supports long-held partnerships can be challenging. Conversely, amid a constantly evolving partner landscape, a closed-source POS solution limits your ability to take advantage of emerging technologies.

Oracle MICROS Simphony empowers restaurants to seamlessly onboard and validate third-party applications, extending point-of-sale capabilities according to business needs. Run on Oracle Cloud Infrastructure, Simphony's industry-leading core POS is built for high performance and secure by design, so you can integrate partners confidently while keeping critical functionality intact.

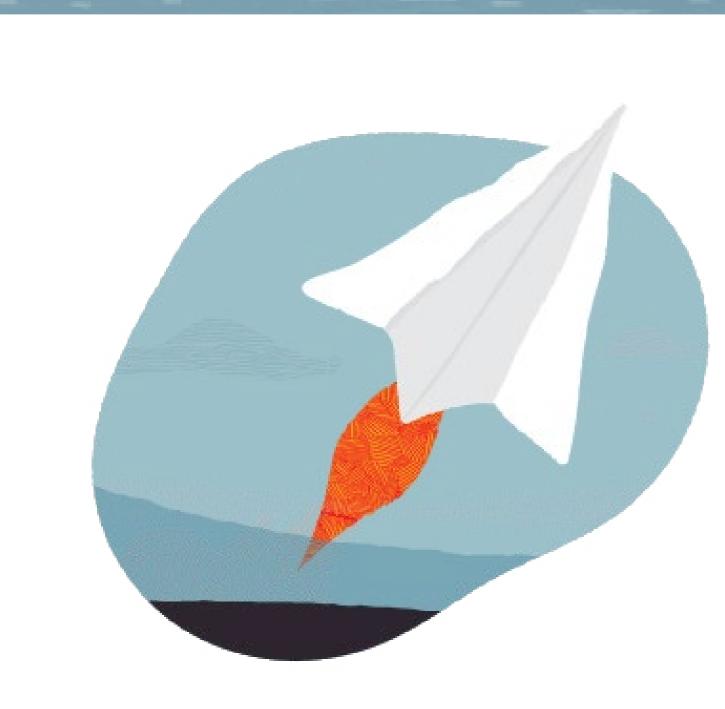

Secure and open API

Non-production sandbox

Supports **low-no code** environments

Here are three ways Oracle MICROS Simphony enables partnerships that enable you.

Sustain time-tested applications that make up your secret sauce

Whether you've integrated a pay-at-table solution or extended your footprint through digital ordering and delivery, partner-powered capabilities helped shape your employee and customer experience. To ensure continuity and minimize disruption, Oracle MICROS Simphony's fully interoperable transaction platform is ready to integrate with the partners you're already using.

Simphony's open and secure APIs can run on Oracle Linux, Android, Microsoft Windows, or in the cloud to enable more partners.

Documentation is publicly available so partners can access and open integrations with ease.

And Oracle Food and Beverage is actively engaged with the RTN open API framework to ensure all parties abide by the same POS integration standards.

According to the Restaurant Technology Network, Oracle MICROS Simphony applies more key principles of open API than any other POS.

Modernize core capabilities

Cloud-native with modern restful APIs, Oracle MICROS Simphony empowers food and beverage brands to take advantage of Oracle's global data centers, supporting regional and local partners while maintaining regulatory compliance.

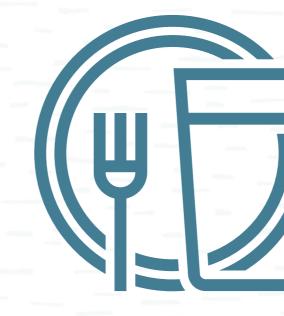

A modern, scalable user interface allows you to evolve your tablet, kiosk, and kitchen displays with images, descriptions, allergen information, and more, so you can support a variety of locations from one control center.

Oracle's partner network includes over 130 validated solutions that are ready to integrate into your environment, without requiring extensive development.

Quickly expand capabilities that improve kitchen performance, open new sales channels, and evolve guest interactions.

Curbside pick-up

Drive-thru

On-the-go mobile ordering

And stay compliant with shifting payment standards with **30 payment partners** who support upgrades and modifications, which can be rolled out from one interface across locations.

Develop new partner interfaces

When your partner ecosystem calls for customization, add a non-production environment to serve as a **sandbox to build and test new developments.**

Low-no code environments provide application access to API endpoints so you can create customizations with agility and speed.

And when needed, Oracle's dedicated engineering team can validate customizations and new partner integrations to ensure they fulfill requirements, before adding them to the open cloud marketplace.

Enable partnerships that strengthen your secret sauce with Oracle MICROS Simphony
